SEE, and an antibody molety, such as tumour reactive antibody 574. The superantigen is engineered to reduce seroreactivity whilst maintaining biological activity and production levels. The conjugates are designed to target and destroy cancer cells, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach, cervix and prostate (claimed)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to peptides which exhibit anti-retroviral activity. The peptides of the invention (AAUISS9-AAUI4009) comprise DP178-like and DP107-like peptides. The DP178 peptide corresponds to amino acids 639-673 of the transmembrane protein gp41 from human immunodeficiency virus 1 (HIV-1) isolate LiAr. The DP107 peptide corresponds to amino acids 558-595 of gp41 from HIV-1LAI. The invention also relates to a method of identifying compounds that inhibit the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying a compound that inhibits the formation of or disrupts a DP107/DP178 complex, especially compounds with antifusogenic, antiviral or intracellular modulatory activity, by detecting the formation of a DP107/DP178 complex.

formation of or disrupts a DP107/DP178 complex. The method comprises detecting the formation of a DP107/DP178 complex, both in the presence or absence of a test compound, in a reaction mixture containing DP107 and DP178 peptides. The method is useful for identifying compounds, including small molecule compounds, which may themselves exhibit antifusogenic, antiviral or intracellular modulatory activity. The DP178-like/DP107-like peptides are useful to inhibit human and non-human retroviral, particularly HIV, transmission to uninfected cells. The present sequence represents a peptide sequence from Staphylococcus aureus enterotoxin type
                                                                                                                                                                                                                                                                                                                                                                                                              180

concentration of a peptide consisting of a region of 16-39 consecutive amino acids of an Epstein-Barr virus protein for an effective period of time, where the region is recognised by one or more of ALLMOTE, 107x178x4 or PLZIP sequence search motifs, the peptide further comprises an amino terminal X, and a carboxy terminal Z in which X comprises an amino terminal X, and a carboxy terminal Z in which X comprises an amino group, acetyl group, 9-fluorenylmethoxy-carbonyl group, hydrophobic group, or macromolecular carrier group, and Z comprises a carboxyl group, amido group, hydrophobic group, or macromolecular carrier group, and clustical of the virus to the call is inhibited. The peptides were identified by analysing the structure/motifs present in the HIV-1 glycoprotein 41 anti-HIV peptides DP107 and DP178. These heptad repeat motific containing peptides were used to design the motifs cited above, which in turn were used to analyse proteins from other pathogenic organisms and HIV isolates, looking for DP107/178 structural analogues. The method is useful for inhibiting transmission of Epstein-Barr virus to a cell and Epstein-Barr virus infection. The present sequence is a protein from a pathogenic organism analysed for regions analogus to DP107 or DP178
                                                                                                                                                                                                                                                                                            ö

```
The invention relates to treating a subject with cancer. The method involves administering an amount of a superantigen (SAg) composition comprising a molecule selected from: a native SAg protein; its biologically active fragment or a biologically active homologue or a biologically active fusion protein comprising the SAg or its fragment or homologue fused to a fusion partner polypeptide or peptide. The SAg is selected from Staphylococcal enterotoxin, a Streptococcal pyrogenic exotoxin, Y. pseudotuberculosis SAg, Mycoplasma arthritides SAg and Clostridium perfringens exotoxin. The method is useful in treating cancer or malignant diseases such as malignant pleural effusion or meningeal carcinomatosis. The present sequence represents a Staphylococcal enterotoxin B (SEB) superantigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                           Treating a subject with cancer or malignant diseases comprises intratumoral, intrathecal or intracavitary administration of an amount of a superantigen composition to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   144

This is the wild-type Staphylococcus enterotoxin SEB superantigen. This SEB superantigen can be modified to be used in a novel conjugate. The novel conjugate comprises a target seeking moiety and a modified wild type superantigen. The modified superantigen retains its ability to activate a subset of T cells, even though 1 or more wild-type amino acid cativate a subset of T cells, even though 1 or more wild-type amino acid cativate in at least 1 region which functions in determining binding to T cell receptor (TCR) and activation of a subset of T cells has/have been corpugate with a target seeking moiety, for activating the immune or system to treat a mammanian disease. A pharmaceutical composition can be prepared comprising a modified antibody (preferably a Fab fragment tused to a peptide moiety providing activation of T cells in Vbeta specific to a peptide moiety providing activation of T cells in Vbeta specific to a peptide moiety providing activation of T cells in Vbeta specific to prohibit cysteine formation. The modified wild-type superantigen is used conting and in the modified wild type superantigen has a lower immunogenicity and reactivity with neutralising antibodies and has fewer immunogenicity and reactivity with neutralising antibodies and has fewer immunogenicity and reactivity with neutralising antibodies and side-effects when used as a drug, compared to wild type superantigen
                                                                                                                                                                                                                                        Conjugate of target seeking moiety and modified superantigen - useful for activating the immune system to treat cancer, viral infections, parasitic infestations and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        180

Staphylococcus enterotoxin SEE modified superantigen.
 20-APR-1998 (first entry)
 Conjugate for therapy, has bacterial superantigen with a region in T-cell receptor and four regions to determine binding to class II major histocompatibility complex, antibody to cancer associated cell surface
                                                                                                                                                                                                                                                                                                                                                        The present sequence is the protein sequence of engineered staphylococcal superantigen SBAB-18. The superantigen is based on staphylococcal enterotoxin E (SBE, see ABPS8456) except for 4 amino acid residues close to the N-terminal that were from enterotoxin A and one substitution in the C-terminal part, D227A. Models of new superantigen variants were constructed using the SBA/B-18 model as the template. These include the new engineered superantigen SBA/B-120 (see ABPS455), which has been genetically fused to the Fab moiety of the tumour reactive antibody 5T4 to form a conjugate (see ABPS8454) polypeptide. The conjugate is a claimed example of novel conjugates of the invention comprising an engineered bacterial superantigen and an antibody moiety. The conjugates are designed to target and destroy cancer cells, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach, cervix and prosetate (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       121 EEKKVPINLWIDGKQTTVPIDKVKTSKKEVTVQELDLQARHYLHGKFGLYNSDSFGGKVQ 180

This is a modified Staphylococcus enterotoxin SEE superantigen. The wild-
type SEE superantigen is modified to be used in a novel conjugate. The
novel conjugate comprises a target seeking modety and a modified wild
type superantigen. This modified superantigen retains its ability to
activate a subset of T cells, even though l or more wild-type amino acid
activate in at least I region which functions in determining binding to T
cell receptor (TCR) and activation of a subset of T cells has/have been
replaced. Such a modified superantigen can optionally be used as part of
a conjugate with a target seeking moiety, for activating the immune
system to treat a mammalian disease. A pharmaceutical composition can be
prepared comprising a modified antibody (preferably a Fab fragment fused
c special moiety providing activation of T cells in Obera specific
c manner) in which cysteines providing for interchain cysteine linkages in
the native antibody have been replaced (preferably by serine residues) to
c prohibit cysteine formation. The modified wild-type superantigen is used
for treating cancer, viral infections, parasitic infestations and
autoimmune disease. The modified wild type superantigen has a lower
immunogenicity and reactivity with neutralishing antibodies and has fewer
immunogenicity and reactivity with neutralishing antibodies and has fewer
immunogenicity and eactivity with neutralishing antibodies and has fewer
cide-effects when used as a drug, compared to wild type superantigen.

Note: This sequence is not provided in the specification. It has been
created by modifying the wild-type SEE superantigen in Pages 38-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Conjugate of target seeking molety and modified superantigen - useful for activating the immune system to treat cancer, viral infections, parasitic infestations and autoimmune diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           tumours. Bacterial superantigens are co-administered or administered as fusion constructs with anti-tumour proteins or motifs. The present sequence represents a bacterial superantigen protein (e.g. a staphylococcal enterotoxin). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from the US patnet office website at "seqdata.uspto.gov/sequence.html?DocID=2002017751"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         84

The invention relates to a mammalian cell receptor, useful in the treatment of cancer, which binds to tumour associated lipids and induces anergy or apoptosis in the T cells and antigen presenting cells (ARCS). Also included are a mammalian cell useful in the treatment of cancer where the receptor which binds tumour associated lipids and induces cellular inactivation or death is deleted or functionally deactivated, producing (MI) a tumouricidal immunocyte population in vivo in a mammal (by allowing tumour associated lipids to contact immunocytes in which receptors for immunosuppressive fatty acids, ceramides, glycolipids, sphingolipids, glycosphingolipids, phosphosphingolipids, gangliosides, sialylated glycans, lipopeptides and proteoglycolipids are inactivated or sialylated glycans, useful in the treatment of cancer comprising a superantigen (SAG) nucleotide inserted into a virus, a mammalian T cell

A mammalian cell receptor, useful in the treatment of cancer by binding to tumor associated lipids where the binding induces anergy or apoptosis

T cells and antigen presenting cells.

Use of staphylococcal enterotoxin(s) and homologues - for treating cancer in a patient or for the treatment of auto-immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequences given in AAR45011-21 are Staphylococcal enterotoxins (SEs) which may be used in the methods of the invention for treating cancer in a patient. These SEs, and homologues of them, can be used as tumouricidal agents for treating cancers and autoimmune disease. They exhibit tumouricidal activity and toxicity identical to that observed for the Protein A perfusion system. They may be administered by i.v. injection. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     64 YNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLTEEK 123

                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a receptor in a mammalian cell that inhibits regular activation by receptors specific for lipid-based tumour associated antigen. The receptor has cytostatic and antimicrobial properties and is suitable for use in gene therapy. The receptors, methods and compositions are useful for treating a neoplastic disease or tumour (cancer), and infectious diseases. This is the amino acid sequence of an entrotoxin superantigen polypeptide the DNA encoding which can be transfected in to a cell alone or with DNA encoding a cell surface moiety to generate antitumour immunity.

It can be used for treating cancer, activating cytokine mediators and procoagulant systems, augmenting natural killer cell cytotoxicity, etc. The enterotoxin can be administered intravenously, optionally with ibuprofen to attenuate toxic reaction to SEE. Synthetic polypeptides having structural homology to staphylococcal exctoxins are claimed, provided the homology includes statistically significant sequence homology, alignment of Cysteine residues and similar hydropathy profiles.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is the protein sequence of enterotoxin E (SEE) of Staphylococcus aureus. Similarity is shown, in several stretches of sequence, between staphylococcal enterotoxins, streptococcal pyrogenic exotoxins and staphylococcal exfoliative toxins (see ABB76214-44). In the present invention, synthetic polypeptides useful in tumour therapy and in blocking or destroying autoreactive T and B lymphocyte populations are characterised by substantial structural homology to staphylococcal enterotoxin A and enterotoxin B, and to streptococcal pyrogenic exotoxins, with statistically significant sequence homology and anilarity (2 value of Lipman and Pearson algorithm in Monte Carlo analysis exceeding 6) to include alignment of cysteine residues and similar hydropathy profiles. These superantigens are used to treat solid tumours, including their metastases, without radiation, surgery or standard chemotherapeutic agents. A claimed method of human cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        one or more superantigens ex vivo to generate stimulated cells, selecting a specific V beta subset of cells, and reintroducing these cells into the patient to induce an in vivo therapeutic, tumouricidal reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 63
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                treatment involves contacting haematopoietic cells from a patient with

The present sequence is the protein sequence of engineered staphylococcal superantigen SEA/E-120. The superantigen is derived from staphylococcal enterotoxin E (SEE) by the incorporation of the following amino acid substitutions to reduce seroreactivity whilst maintaining production levels and biological activity: R206, N21T, S246, R27K, K79E, K81E, K81S and D227S. SEA/E-120 has been genetically fused to the Fab moiety of the tumour reactive antibody 5T4 to form a claimed conjugate (see ABPS8454) designed to target and destroy cancer cells, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach, cervix and prostate (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Conjugate for therapy, has bacterial superantigen with a region in T-cell receptor and four regions to determine binding to class II major histocompatibility complex, antibody to cancer associated cell surface

```

The present sequence is a conjugate of a bacterial superantigen and an antibody moiety, and has been designed to target and destroy cancer cells. The bacterial superantigen is SEA/E-120 (see also ABPS8455), which was derived from staphylococcal enterotoxin E (SEB) by the incorporation of the following amino acid substitutions to reduce seroreactivity whilst constraining production levels and biological activity: R20G, N31T, S24G, R27K, K79E, K81E, K83S and D22/S. SEA/E-120 was genetically fused to the Fab moiety of the tumour reactive antibody 574. Substitutions were made in the 574 sequence to obtain higher yields: in the heavy chain, H41P, S44G, 1697 and V113G; and in the light chain, F10S, T45K, 163S, F73L, T77S, L78V and L83A. An expression vector comprising DNA encoding the conjugate can be used to transform host cells for recombinant production of the conjugate is useful for treating cancer, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach,

Sequence 672 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cancer, activating cytokine mediators and procoagulant systems, augmenting natural killer cell cytotoxicity, etc. The enterotoxin can be administered intravenously, optionally with ibuprofen to attenuate toxic reaction to SEA. Synthetic polypeptides having structural homology to Staphylococcal exotoxins are claimed, provided the homology includes statistically significant sequence homology, alignment of Cysteine residues and similar hydropathy profiles.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is the protein sequence of staphylococcal enterctoxin A (SEA). The invention provides movel conjugates (see ABP58454) for human cancer therapy. These comprise an engineered bacterial superantigen, such as novel SEA/E-120 (see ABP58455), and an antibody molety, such as tumour reactive antibody 574. Bacterial modelling of the engineered superantigens. The superantigens were engineered to reduce seroreactivity whilst maintaining biological activity and production levels. The novel conjugates were designed to target and destroy cancer cells, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach, cervix and prostate (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 SEKSEEINEKDLRKKSELORNALSNIRQIYYYNEKAITENKESDDOFLENTLLFKGPFTG

The present invention relates to peptides which exhibit anti-retroviral activity. The peptides of the invention (AAU12559-AAU14009) comprise activity. The peptides of the invention (AAU12559-AAU14009) comprise the peptide of Delta Peptide corresponds to amino acids 619-673 of the transmembrane protein gp41 from human immunodeficiency virus 1 (HIV-1) isolate LAI. The DP107 peptide corresponds to amino acids 558-595 of gp41 from HIV-LIAI. The invention also relates to a method of identifying compounds that inhibit the corresponds to amethod of identifying compounds that inhibit the corresponds to distrupts a DP107/DP178 complex. The method comprises detecting the formation of a DP107/DP178 complex, both in the presence or absence of a test compound, in a reaction mixture containing DP107 and DP178 peptides. The method is useful for identifying compounds, including small molecule compounds, which may themselves exhibit antifusogenic, antiviral or intracellular modulatory activity. The DP178-like/DP107-like peptides are useful to inhibit human and non-human retroviral, peptides sequence from Staphylococcus aureus enterotoxin A represents a peptide sequence from Staphylococcus aureus enterotoxin A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120

The invention relates to inhibiting (M) transmission of an Epstein-Barr virus to a cell, comprising contacting the cell with an effective virus to a cell, comprising contacting the cell with an effective concentration of an Epstein-Barr virus protein for an effective period of time, where the region is recognised by one or more of ALMOTIS, comprises an amino terminal X, and a carboxy terminal Z in which X comprises an amino group, acetyl group, 9-fluorenylmethoxy-carboxyl group, hydrophobic group or macromolecular carrier group, and Z comprises a carboxyl group, and group, hydrophobic group, or macromolecular carrier group, and fusion of the virus to the cell is inhibited. The peptides were identified by analysing the structure/motifs present in the HIV-1 clantified by analysing the structure/motifs present in the HIV-1 clantified by analysing the structure/motifs present in the HIV-1 containing peptides were used to design the motifs cited above, which in turn were used to analyse proteins from other pathogenic organisms and HIV isolates, looking for DP107/178 structural analogues.

The method is useful for inhibiting transmission of Epstein-Barr virus in a cell and Epstein-Barr virus infection. The present sequence is a cell and experient from a pathogenic organism analysed for regions analogous to ö 9 1 SEKSEEINEKDLRKKSELQRNALSNLRQIYYYNEKAITENKESDDQFLENTLLFKGFFTG Gaps .; 0 82.6%; Score 1023; DB 6; Length 257; 82.0%; Pred. The invention relates to novel oligonuclectide primers directed against enterotoxin A gene (ent A) of Staphylococcus aureus and heat stable enterotoxin gene (yst) of bacteria Yersinia enterocolitica. The novel oligonuclectide primers are useful for simultaneously detecting food poisoning bacterial species Staphylococcus aureus and/or Yersinia enterocolitica in food systems e.g., milk, fruit juices and ice creams, without prior enrichment for preventing food poisoning outbreak. The PCR detection method is useful for detecting the bacteria strains in quantity as low as one cell. The method can be directly used for detecting bacterial strains. The oligonuclectide primers allow quick and highly sensitive detection of the food poisoning bacterial species. This sequence represents the protein derived from the enterotoxin A gene from Staphylococcus aureus of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                HPWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQCAGGTPNKTACWYGGVTLHDNNRLT 120

A cDNA clone (AAT45699) codes for staphylococcal enterotoxin A (AAW06738) superantigen. Nucleic acids encoding superantigens (see also AAW06737, AAW06739), esp. truncated forms of the superantigen lacking the leader peptide, can be used in the gene therapy of cancer, infectious diseases and immunological disorders. The nucleic acid, optionally in combination with cytokine or chemokine nucleic acids, is delivered to an animal using e.g. liposomes. It acts by controlling the activity of effector cells, such as T-cells, macrophages, monocytes and/or natural killer cells. Localised prodn. Of an effective but non-toxic amount of encoded proteins allows safe treatment of the animal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method for computational design and selection of protein binding peptides, comprising computing the hydrophobic potential of all surface points arranged on the solvent contact surface of a protein three-dimensional structure, developing a two-dimensional characteristic map by a self-assembly method, identifying a region of hydrophobic amino acids by Fourier transformation and designing a protein binding peptide corresponding to the hydrophobic region. The method is useful for designing and selecting protein binding peptides. This sequence represents an Enterotoxin A protein used in the scope of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Designing and selecting protein binding peptide by identifying peptide binding region of protein, and designing peptides that bind to the region using structure-biological activity relationship program of computer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       HPWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLT 120

comprising administering to a subject an overlapping synthetic peptide formulation (OSPP) which comprises a combination of single chain peptides corresponding to the amino acid sequence of a protein of interest. The method of the invention has immunostimulant, virucide, antibacterial, antiparasitic and cytostatic applications and may be useful during vaccine production and for treating immune disorders including viral, bacterial and parasitic infections, prion diseases, neoplastic diseases, as well as providing protection against toxins. The current sequence is that of the OSPF-related Staphylococcus aureus enterotoxin A protein of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g an immune response, useful for treating immune disorders, e.g. cterial and parasitic infections, prion diseases, or neoplastic administering to a subject an overlapping synthetic peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel method for modulating an immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SEKSEEINEKDLRKKSELQRNALSNLRQIYYYNEKAITENKESDDQFLENTLLFKGFFTG

This is the wild-type Staphylococcus enterotoxin SEA superantigen. This SEA superantigen can be modified to be used in a novel conjugate. The convel conjugate comprises a target seeking moiety and a modified wild type superantigen. The modified superantigen retains its ability to activate a subset of T cells, even though lor more wild-type amino acid residues in at least 1 region which functions in determining binding to T cellareceptor (TCR) and activation of a subset of T cells has/have been crepaced. Such a modified superantigen can optionally be used as part of a conjugate with a target seeking moiety, for activating the immune cystem to treat a mammalian disease. A pharmaceutical composition can be prepared comprising a modified antibody (preferably a Fab fragment fused to peptide moiety providing activation of T cells in Wheta specific to a peptide moiety providing activation of T cells in Wheta specific to a peptide moiety providing activation of T cells in Wheta specific to prohibit cysteine formation. The modified wild-type superantigen is used for treating cancer, viral infections, parasitic infestations and autoimmune disease. The modified wild type superantigen has a lower immunogenicity and reactivity with neutralising antibodies and has fewer cimmunogenicity and reactivity with neutralising antibodies and has fewer side-effects when used as a drug, compared to wild type superantigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Conjugate of target seeking moiety and modified superantigen - useful for activating the immune system to treat cancer, viral infections, parasitic infestations and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 HPWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLT 120

Use of staphylococcal enterotoxin(s) and homologues - for treating cancer in a patient or for the treatment of auto-immune diseases.
                 EEKKVPINLWIDGKQTTVPIDKVKTSKKEVTVQELDLQARHYLHGKFGLYNSDSFGGKVQ 180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  which may be used in the methods of the invention for treating cancer in a patient. These SEs, and homologues of them, can be used as tumouricidal aperts for treating cancers and autoimmune disease. They exhibit tumouricidal activity and toxicity identical to that observed for the Protein A perfusion system. They may be administered by i.v. injection. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequences given in AAR45011-21 are Staphylococcal enterotoxins (SEs)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SEKSEBINEKDLRKKSELQGTALGNLKQIYYYNEKAKTENKESHDQFLXHTILFKGFFTD

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a tumour cell capable of stimulating antitumor immune reactivity in vitro or in vivo contains and expresses an exogenous nucleic acid molecule encoding a superantigen or its active fragment and an exogenous nucleic acid molecule encoding a costimulatory molecule fabra activates T cells in conjunction with an antigenic stimulus. The invention may be used for cancer therapy by stimulating an anticancer immune response in vivo or ex vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        HSWYNDLLVDFDSKDIVDKYKGKKVDLYGAYYGYQCAGGFPNKTACMYGGVTLHDNNRLT 120

The invention relates to a mammalian cell receptor, useful in the treatment of cancer, which binds to tumour associated lipids and induces anergy or apoptosis in the T cells and antigen presenting cells (APCB).

Also included are a mammalian cell useful in the treatment of cancer where the receptor which binds tumour associated lipids and induces cellular inactivation or death is deleted or functionally deactivated, producing (M1) a tumouricidal immunocyte population in a mammal companient of the producing (M1) a tumouricidal limpids to contact immunocytes in which receptors for immunosuppressive fatty acids, ceramides, glycolipids, sphingolipids, glycosphingolipids, phosphosphingolipids, cancer comprising alalylated glycans, lipopeptides and proteoglycolipids are inactivated or deleted, a construct useful in the treatment of cancer (where an adaptor protein which inhibits T cell activation by tumour associated antigens is deleted or functionally deactivated), a composition useful in the treatment of cancer (comprising a lipid raft conjugated to a superantigen in the treatment of cancer (comprising a lipid raft conjugated to a superantigen), producing (M2) a tumouricidal immunocyte population ex vivo in a mammal (by cancer treatment associated lipids are inactivated or deleted to produce a superantigen).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Superantigen, SAg; staphylococcal enterotoxin; tumour; cancer; apoptosis; gene therapy; mammalian cell receptor; tumour associated lipid; anergy; T cell; antigen presenting cell; tumouricidal immunocyte; cytostatic; APC; antitumour.

                                                                                                                                                                                                                                                                    ö
                                                                                                        The invention describes a receptor in a mammalian cell that inhibits regular activation by receptors specific for lipid-based tumour associated antigen. The receptor has cytostatic and antimicrobial properties and is suitable for use in gene therapy. The receptors, methods and compositions are useful for treating a neoplastic disease or tumour (cancer), and infectious diseases. This is the amino acid sequence of an entrotoxin superantigen polypeptide the DNA encoding which can be transfected in to a cell alone or with DNA encoding a cell surface moiety to generate antitumour immunity.

Staphylococcus aureus. Similarity is shown, in several stretches of sequence, between staphylococcal enterotoxins, streptococcal pyrogenic excutants and staphylococcal excotoxins, streptococcal pyrogenic excotoxins and staphylococcal excotoxins, streptococcal pyrogenic present invention, synthetic polypeptides useful in tumour therapy and in blocking or destroying autoreactive T and B lymphocyte populations are characterised by substantial structural homology to staphylococcal enterotoxin A and enterotoxin B, and to streptococcal pyrogenic exctoxins, with statistically significant sequence homology and similarity (Z value of Lipman and Pearson algorithm in Monte Carlo analysis exceeding 6) to include alignment of cysteine residues and similar hydropathy profiles. These superantigens are used to treat solid tumours, including their metasteases, without radiation, surgery or strandard chemotherapeutic agents. A claimed method of human cancer treatment involves contacting haematopoietic cells from a patient with

The present sequence is the protein sequence of staphylococcal enterotoxin A (SEA) vaccine, periplasmic (A489270P). The vaccine comprises 3 amino acid substitutions introduced into the SEA sequence: Comprises 3 amino acid substitutions reduce the binding of the toxin to major histocompatibility complex (MHC) Class II and/or T cell receptors. The full-length expressed product is secreted into the periplasmic space of Escherichia coli host cells, and the leader peptide is recognised and cleaved by a native mechanism. The vaccine is used to protect against upperantigen toxin infections. Superantigen attributes are absent, but the superantigen toxin infections. Superantigen toxins were shown to protect animals appropriate antibody response is produced. In examples from the invention, attenuated superantigen toxins were shown to protect animals invention, attenuated superantigen toxins were shown to protect animals the altered superantigen toxins as vaccines, and in diagnosis and the altered superantigen toxins as vaccine consisting of altered to provide protective immunity against the majority of bacterial superantigen toxins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel isolated and purified superantigen toxin DNA fragment which has been genetically altered, useful for producing vaccine for treatment of superantigen toxin-associated bacterial diseases.

The invention relates to an isolated and purified superantigen toxin and/or DNA fragment, which has been altered so that the binding of the encoded toxin to either major histocompatibility complex (MHC) class II or T cell antigen receptor is altered. The superantigen toxins, DNA fragments, and vaccines are useful for treating or ameliorating superantigen-associated bacterial infection. The DNA fragments are particularly useful for producing vaccine against superantigen toxin infections. The transformed host cells are useful for analysing the effectiveness of drugs and agents that affect the binding of superantigens to MHC class II or T-cell antigen receptors. The present sequence represents the amino acid sequence of staphylococcal enterotoxin New superantigen toxin and/or DNA fragment with an altered binding of the encoded altered toxin to either MHC class II or T cell antigen receptor, useful for treating or ameliorating superantigen-associated bacterial Enterotoxin A; superantigen-associated bacterial infection; vaccine; Claim 10; Page 18-19; 50pp; English.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated and purified superantigen toxin DNA fragment is altered so that binding of the encoded altered toxin to either the MHC class II or T cell antigen receptor is altered. Also included are a recombinant DNA construct (comprising a vector and an isolated and purified altered superantigen toxin DNA fragment), a host cell transformed with the recombinant DNA construct, producing altered superantigen toxin, an altered TSST-1 (toxic shock syndrome toxin) superantigen toxin peptide, diagnosing superantigenassociated bacterial infection, a vaccine (comprising an altered superantigen toxin for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            producing antigenic and immunogenic response resulting in the protection of a mammal against superantigen-associated bacterial infection), treating/ameliorating a superantigen-associated bacterial infection, an antisera isolated from individuals immunised with one or more altered TSST-1 superantigen toxin and an antibody which recognises altered TSST-

DNA fragments of the invention are useful in the production of vaccines against bacterial superantigen toxin infections. They are also useful in gene therapy. The present sequence is a protein related to the
                                                                                                                                                                                                                                                                                                                                                                                                                                      25 SEKSEEINEKDLRKKSELQGTALGNLKQIYYYNEKAKTENKESHDQFRQHTLFKGFFTD 84
1. Also disclosed are mutated staphylococcal enterotoxin A, B, Cl (SEA, SEB, SEC1) and streptococcal pyrogenic enterotoxin a and b (SPEa and SPEB). The superantigen toxin DNA fragment is useful for preparing a composition for treating or preventing bacterial infection. The present sequence represents the LASELA8R/DYOR/Y896/Y92A (with reference to the mature protein sequence) mutant of periplasmic SEA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      useful for preparing a composition infection.
